gene. The human OPA gene is derived from the PCTG4 region of chromosome Xq13. Polymorphisms in this region are associated with mental retardation, autism, depression, bipolar affective disorder or hypothyroidism. One 12 bp insertion polymorphism occurs within the coding region of the human OPA gene, and introduces a 4 amino acid insertion in a putative OPA domain. This domain has been shown to be involved in tissue specific expression. Another polymorphism consists of a pentanucleotide repeat approximately 7 kb upstream of the 12 bp polymorphism. Another polymorphisms consists of a dinucleotide repeat approximately 7 kb upstream of the 12 bp polymorphism. The specification describes a method for screening for polymorphisms in a PCTG4 nucleic acid sequence obtained from a subject. The PCTG4 related sequences within the q13 region of the X chromosome have polymorphisms to associated with neuropsychiatric disorders. The methods can be used to screen for the presence of a heritably linked form of mental

The present sequence represents the CDNA sequence of the human OPA gene, which is derived from the human PCTG4 region of chromosome Xq13.

Polymorphism in this region are associated with mental retardation, autism, depression, bipolar affective disorder or hypothyroldism.

Cone 12 bp insertion polymorphism occurs within the coding region of the human OPA gene, and introduces a 4 amino acid insertion in a putative OPA domain. This domain has been shown to be involved in tissue specific expression. Another polymorphism consists of a pentanucleotide repeat approximately 7 kb upstream of the 12 bp polymorphism. Another polymorphisms on the 12 bp polymorphism. Another polymorphism. The specification describes a method for screening for polymorphisms in a PCTG4 nucleic acid sequence obtained from a subject. The PCTG4 related sequences within the q13 region of the X chromosome have polymorphisms associated with the q13 region of the X chromosome have polymorphisms associated with

```
This is the nucleotide sequence of a gene encoding a mouse SRY-related protein. The gene was isolated from a mouse genomic library using a cDNA fragment amplified by primers 133009-10 as a probe. The screen isolated 4 EcoRI fragments of 2.3, 2.8, 3.5 and 1.5 kb covering the gene. Sequence analysis revealed a 240 bp HMG box sequence between bases 7154-7393. Similarity with the human SRY HMG box sequence resulted in primers being generated to amplify the human SRY HMG box sequence for use as a probe to isolate the bovine SRY Telated gene (133008). The mouse and boyine genes are useful for determining the sex of an animal prior
                                                                                                                                         Bovine and mouse Sry-related DNA - useful for detecting e.g. the sex of unborn animals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at
http://www.genoscope.cns.fr/Tetraodon.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                ;
                                                                                                                                                                                                 The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields conty. crops. This sequence (SEQ ID No.3 in the specification) contains apparent discrepancies (see feature table) with a supposedly identical sequence (fig 2), since it is unclear from the specification which of these is correct, both sequences have been indexed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  XX DX XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;
                                                                                                                                                                                                                                                                                                                                               The sequence is that of a gene encoding a glyphosate oxidoreductase (GOR) enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in flelds contg. crops. This sequence (fig 2) contains apparent discrepancies (see feature table) with a supposedly identical sequence (SEQ ID No.3 in the specification), since it is unclear from the specification which of these is correct, both sequences have been indexed. See also Q20833-Q20841 and Q20832 - the alternative sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    359
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      419

                                                                                                                                                                                                                                                                       The sequence is that of the gene encoding a glyphosate oxidoreductase (GOR) enzyme which has been manipulated such that it is suitable for introduction into and expression in plant transformation vectors, but it still encodes the wild type GOR enzyme. It was obtd. from bacterial isolate LBAA. It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant. Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops. See also Q20832-Q20841 and Q22705.

                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of the gene encoding a glyphosate oxidoreductase (GOR) enzyme which has been modified using mutagenic primers. The gene sequence was redesigned to eliminate as much as possible the following sequences or sequence features (while avoiding the introduction of unnecessary restriction sites), stretches of G's and C's of 5 or more: A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently found in plant genes. The G + C% of GORD gene was reduced from 56% in the manipulated version content of the GOR gene was reduced from 56% in the manipulated version. However it still encodes the wild type GOR enzyme. It was obtd. from bacterial isolate LBAA.

It is used to transform plants such that they express the enzyme sufficiently to enhance the glyphosate tolerance of the plant.

Transformed plants resistant to glyphosate can be obtd. so that weeds can be selectively controlled in fields contg. crops.

                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of the gene encoding a glyphosate oxidoreductase (GOR) enzyme, the gene sequence was synthesised so that it could be redeasigned to eliminate as much as possible the following sequences or sequence features (while avoiding the introduction of unnecessary restriction sites), stretches of G's and C's of 5 or more; A + T rich regions (predominantly) that could function as polyadenylation sites or potential RNA destabilisation regions, and codons not frequently found in plant genes. The G + CB for the synthetic gene is 51% and the potential to form short, high energy, hair-pin structures is reduced. However it still encodes the wild type GOR enzyme. It is used to transform plants such that they express the enzyme such that they express the enzyme. The sufficiently to enhance the glyphosate tolerance of the plant.

Transformed plants resistant to glyphosate can be obtd. so that the each can be selectively controlled in fields contg. crops.
                                                                                                                                                                                                                                                                                                                                                                                    Gene encoding glyphosate oxido-reductase enzyme - used to transform plants to produce plants tolerant to glyphosate herbicide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                297
                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capa of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.

```
A chemically inducible plant gene expression cassette which comprises an inducible promoter linked to a gene (I) that confers resistance to a herbicide, is calimed. (I) imparts resistance to N-phosphonomethyl.

Glycine (glyphosate) or its salts, but may also be a gene for resistance to, e.g. chlocoacetanilides, glufosinate, sulphonyl ureas, imidazolones, etc. The inducible promoter (e.g. alch, alck, alck, other alck induced gene promoter) is operatively linked to an alck regulator sequence.

Induced expression of (I) avoids the risk that constitutive expression of (I) avoids the risk that constitutive expression controlled by herbicide applied without inducer and minimises the chance that herbicide-resistant strains of weeds will arise. The expression cassette is strictly controlled and suitable for general use in plants (both mono- and dicctyledons). The alch/alck gene switch was exemplified with genes conferring resistance to glyphosate. The switch was used to citive inducible expression of glyphosate oxidace (COX) in plants.

Switchable GOX was expressed alone or in conjunction with constitutive expression of 5-enol-pytuvylshikimate 3-phosphate (EBSPS) CP4. Constructs were optimised for expression in mono- and dicctyledonous crop species. The present sequence comprises a fusion of the GOX gene fused to the chloroplast transit sequence if from Arabidopsis RUBISCO (CP71). This sequence was ligated into pwJB1 (see T8566) and used in construction of
                                                                                                                                                                 expression cassette; inducible promoter; alcA; alcA; regulator; alchol dehydrogenase; herbicide resistance gene; glyphosate; N-phosphonomethyl-glycine; glyphosate oxidase; GOX; EPSPS; 5-enol-pyruvylshikimate 3-phosphate CP4; chloroplast transit sequence 1; Arabidopsis; RUBISCO; CPT1; dicotyledon; monocotyledon; crop; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chemically inducible cassette for expressing herbicide resistance gene in plants - and derived plants, partic. for resistance to glyphosate, avoids constitutive expression and minimises development of herbicide tolerant weeds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1631 BP; 342 A; 454 C; 381 G; 454 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel sugar beet plant, including its descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.

                                                                                                                                                                                                                                                                                                              descendants expressing 5-enolpyruvylshikimate-3-phosphate synthase (cp4/epsps) enzyme activity which is obtainable by Agrobacterium mediated transformation with a gene allowing expression of cp4/epsps in plants, where the plant lacks both right and left T-DNA border sequences. The transgenic sugar beet plants of the invention are capable of tolerating herbicide treatment with glyphosate (also known as N-phosphonomethyl-glycine) as the active ingredient, e.g. Roundup.

nucleotide sequence are claimed. The nucleotide sequences or ORFs can be used e.g. in the transportation of compounds to and from an organism which is a host to at least one of the nucleotide sequences, ORFs or proteins, the degradation and/or metabolism of organic, inorganic, natural or xenobiotic substances in a host organism or the modification of the host range, nitrogen fixation abilities; for obtaining a synthetic minimal set of ORFs required for functional Rhizobium-legume symblosis, especially for nodulation efficiency on host plants.

soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. acruginosa infection.

Is a P. acruginosa infections.

In some instances given in the specification were poorly legible, and in some instances assumptions were made as to the identity of the base; it is therefore possible that the sequence given below is not entirely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a Pseudomonas aeruginosa nucleic aicd sequence. P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be

P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a p. aeruginosa infection. The sequences given in the specification were poorly legible, and in some instances assumptions were made as to the identity of the base; it is therefore possible that the sequence given below is not entirely
used to treat pathogenic infections, especially where the infection is a P. aeruqinosa infection. note: the sequences given in the specification were poorly legible, and in some instances assumptions were made as to the identity of the base; it is therefore possible that the sequence given below is not entirely
                                                                                                                                                                                                                                                                              394

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence. P. acruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding such polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. acruginosa infection.

In some instances assumptions were made as to the identity of the base; it is therefore possible that the sequence given below is not entirely
                                                                                                                                                                                                                    The present sequence represents a Pseudomonas aeruginosa nucleic aicd
